OXANDROLON

Active Ingredients: Oxandrolone 10 mg

DISCRIPTION

OXANDROLON tablets contain the main substance oxandrolone, a synthetic derivative of testosterone. Oxandrolone stimulates the anabolic processes and inhibits the catabolic ones, which is caused by glucocorticoids. That brings to an increase in muscle mass, improvement of connective tissue and a decrease in body fat. Oxandrolone is a synthetic, anabolic steroid hormone analog of testosterone. Similar to testosterone, oxandrolone binds to and activates specific nuclear receptors. This agent may be used for testosterone replacement therapy in hypogonadal men, in HIV-wasting syndrome, and in other conditions in order to increase nitrogen retention and fat-free muscle mass. Oxandrolone is a 3-oxo steroid, an oxa-steroid, a 17beta-hydroxy steroid and an anabolic androgenic steroid. It has a role as an androgen and an anabolic agent.
